Yucca Mountain:

I am writing to voice my concerns of what I have learned about the nuclear projects that have been going on. I personally respect the precautions that you have been taking to ensure the safety of the citizen of the United States. On the other hand, I don't believe that you respect that power of what we are dealing with. Radiation is a lethal weapon that we overlook. Since the early 50's the world has been exploring nuclear power. We have discovered that it creates man made and biological weapons. I hear on the news that radiation from working on such projects have  
1 caused them to have cancer and they are just realizing it now. [My question for you is how can you be sure that we won't all be exposed to radiation and the young engineers in fifty years will have cancer?

I have learned that you will never be positive on the amount of radiation that we *might* be exposed to. Before even beginning to create such large amounts of nuclear power and storage of  
2 radiation you first must be sure that there are no glitches. [I also recommend telling the U.S what measures you are taking to be positive that the nuclear waste you are disposing of will not leak  
3 into the environment.] I have learned from history that the worst things happen to people who don't have a way out. Before you start this project be sure to have a way out. [
